

LASTİK TAMİR KİTİ

Description

Repairs tires quickly and effectively by sealing punctures in case of emergency.

Applications

Vehicle tires

Benefits

- Suitable for all types of tires, both tubed and tubeless.
- Does not damage the ozone layer.
- Suitable for repairing major damage and sidewall damage.

Usage and Considerations

Ensure that the tire valve stem is positioned at either the 4:00 or 8:00 o'clock position. Remove the tire valve extension or cap if present. Shake the canister well.

Remove the cap from the canister and attach the product hose to the tire valve by twisting. Keep the canister upright and press the trigger to allow the product to flow into the tire. Continue until the tire is fully inflated.

You will notice the deflated tire inflating and being repaired in a very short time. To ensure the foam spreads evenly, immediately drive your vehicle so the tires are in motion.

If the object that caused the tire puncture is still inside, we recommend leaving it in place.
